# Status Report #25

2020. 05. 01 (Fri)

M1 FUJIWARA Tomomasa

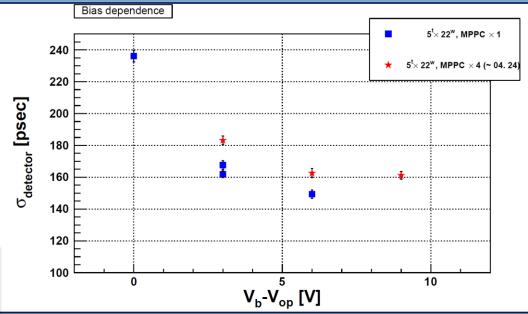

#### Cosmic - ray

✓ 電圧を細かく変えてデータ取得をしていた

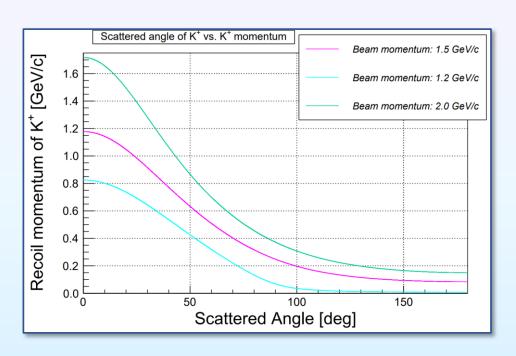

2020. 05. 01 (Fri) NKS2 meeting

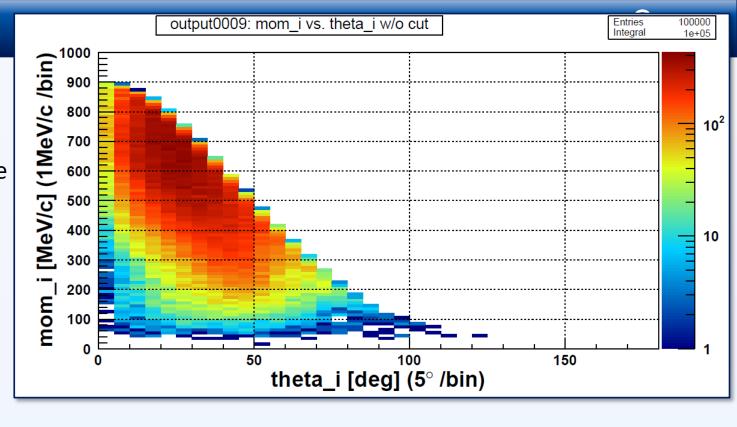

Status report #25

- ・ 同じ電圧でも値の揺れが大きい
- 来週にかけて複数回測定を行う予定
- 1run/day くらいで短く区切って様子を見る

- ✓ At last NKS2 meeting...
- ✓ mom\_i (Initial momentum) dist. has broad range
- ✓ Why?

✓ Check source code (input.in, KMaidKpLambda.cc, PrimaryGenerateAction.cc ...)

✓ /input/input.in

```
###### Beam property #####

BeamPar: 5 # 1:e+ 2:mu+ 3:pi+ 4:K+ 5:p 6:d 7:e- 9:gamma 11:mu- 12:pi-

BeamType: 2 # 0:Fix beam(fast gen) 1:Uni 2:Uni at T 3 KMaidUniformAtTarget 4 QF Kaon in 3He

BeamMom: 500.0 # momentum (MeV)

BeamRMom: 20.0 # momentum range (%)
```

✓ In this case,

Particle: proton

Beam: Generated uniform at target

Initial momentum: 300 - 700 MeV/c (Central momentum: 500 MeV/c)

Previous figure:

BeamType: 3

#### ###### Beam property ######

BeamPar: 4 # 1:e+ 2:mu+ 3:pi+ 4:K+ 5:p 6:d 7:e- 9:gamma 11:mu- 12:pi-

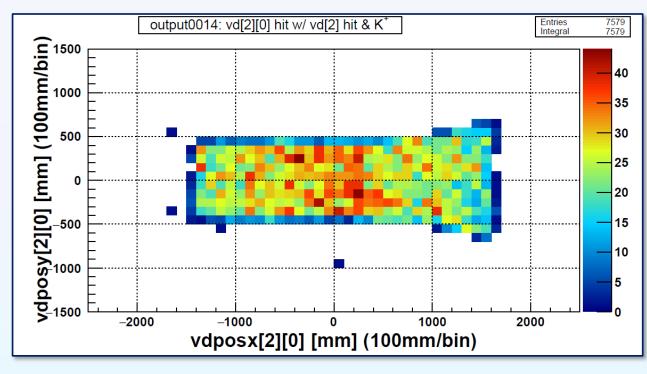

BeamType: 3 # 0:Fix beam(fast gen) 1:Uni 2:Uni at T 3 KMaidUniformAtTarget 4 QF Kaon in 3He

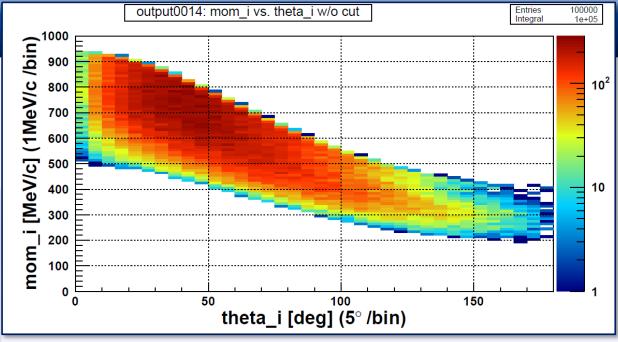

BeamMom: 500.0 # momentum (MeV)

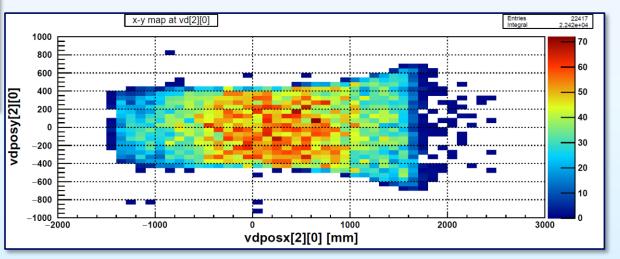

BeamRMom: 40.0 # momentum range (%)

- In this case,
- call PrimaryGenerateAction::GenerateQuasiFreeKaonUniformAtTarget
  - $\Rightarrow$  p( $\gamma$ , K<sup>+</sup>) $\Lambda$  reaction
- If choose "4 QF Kaon in 3He",
- call PrimaryGenerateAction::GenerateHyperNucleusKaonUniformAtTarget
- $\Rightarrow$   $^{A}Z(\gamma, K^{+})^{A}_{\Lambda}Z 1 \text{ reaction } \Rightarrow {}^{3}He(\gamma, K^{+})^{3}_{\Lambda}H$

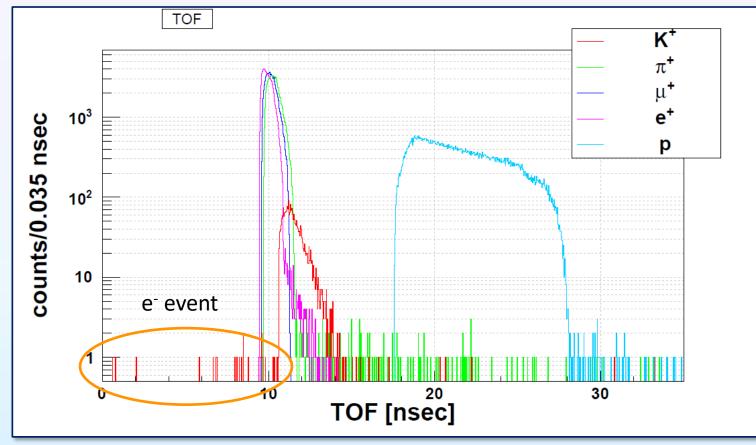

• 後方へ飛ぶ粒子の割合が多くなった

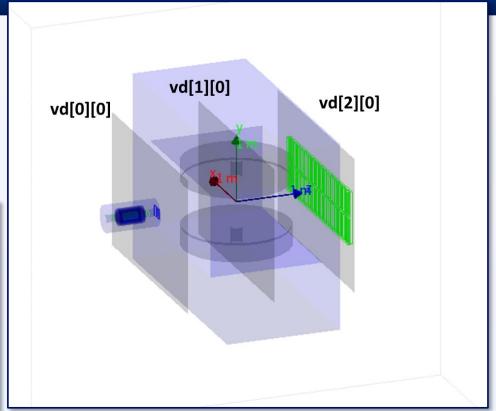

- $e^+$ ,  $\mu^+$ ,  $\pi^+$ , p: momentum= 300 700 MeV/c,  $\theta = 0^\circ 10^\circ$ ,  $\times 100,000$
- Compare TOF between vd[2][0] and vd[0][0] (z = 2800 mm = 2.8 m)
- vd[2][0], vd[1][0], vd[0][0] のすべてでヒットしたものを採用

 $e^+, \mu^+, \pi^+, p:\sim 90,000$  events

- vd[0], vd[2]のいずれでもヒットした粒子がK+であることを 要請すると, vd[2][0]でのヒット数が~ 5000 減少した
- virtual detector間でのTOFを組む際にはpidで 選別をかければ問題は無しか?

#### ✓ 今後

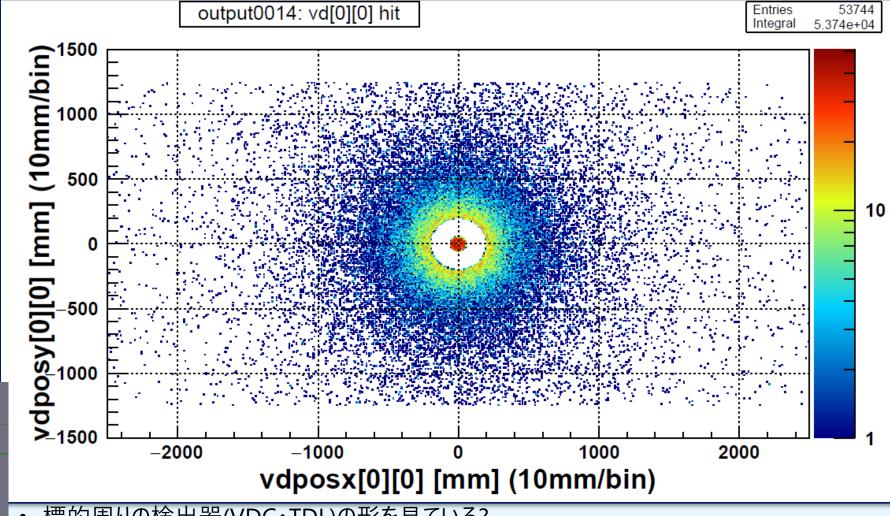

- 標的の物質: 現在 "G4\_Galactic" = 真空
- 実際の液体3Heなどを定義して導入するべきかと考えている

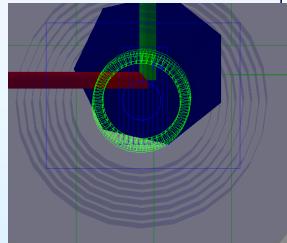

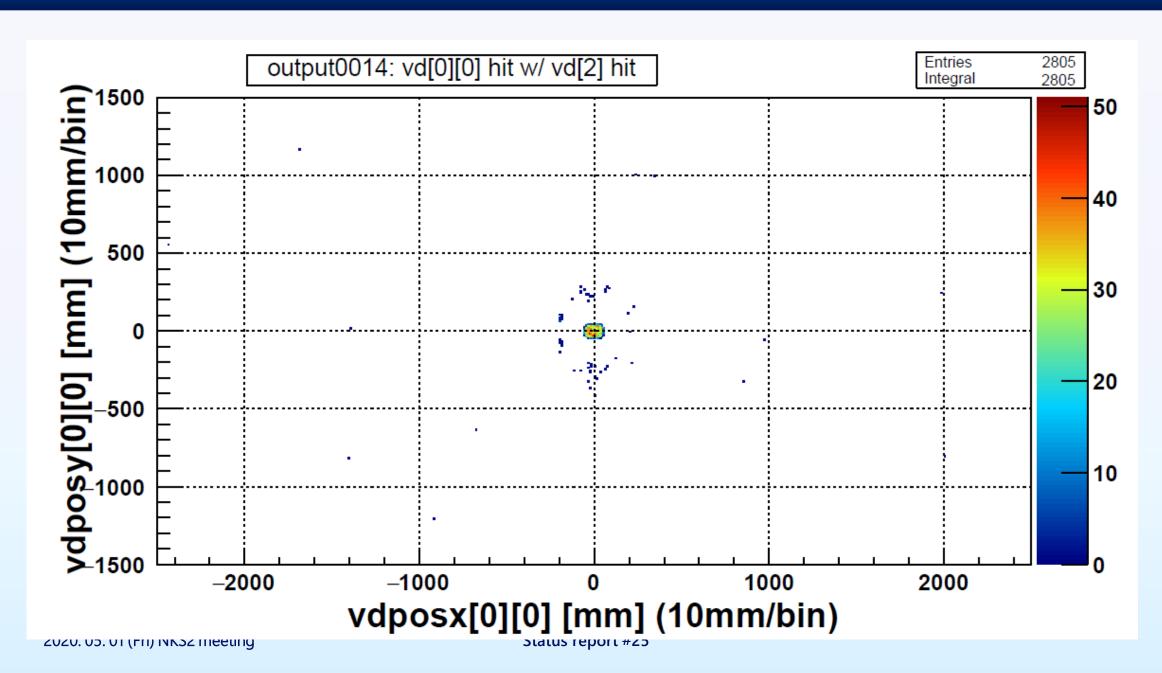

標的周りの検出器(VDC・TDL)の形を見ている?

- 卒論: 現在進行中.
- Detector Seminar: 準備中
- ハイペロン生成反応の閾値エネルギーの計算をもう1度自分でやってみた
- CM系で計算 ⇒ 実験室系にローレンツ変換で出来た

$$p^{th} = \frac{1}{2m_A} \left[ \left\{ (m_b + m_B)^2 - m_a^2 - m_A^2 \right\} - 4m_a^2 m_A^2 \right]^{\frac{1}{2}}$$

・ 実光子(入射粒子の質量0)の場合を仮定し,  $m_a=0$   $p^{th}=911~{\rm MeV}/c$
